

Exercises (functions)

Exercise 1

Create a function called `welcome()` that displays:

```
Welcome to Python Programming!
```

Call the function three times.

Exercise 2

Create a function that receives two numbers and returns their sum.

Display the returned value.

Exercise 3

Create a function called `is_even()`.

The function receives one number.

Return `True` if the number is even; otherwise, return `False`.

Exercise 4

Create a function called `calculate_area()`.

The function receives the length and width of a rectangle.

Return its area.

Exercise 5

Create a function that receives a student's name and grade.

Display:

```
Student: Ali  
Grade: 18
```

Mini Project

Student Grade Calculator

Create a program that includes the following functions:

- `get_student_data()` → Reads the student's name and three grades.
- `calculate_average()` → Returns the average grade.
- `get_result()` → Returns "Pass" or "Fail" based on the average.
- `display_report()` → Displays the student's name, average, and result.

The main program should call these functions to produce a complete student report.
